OpenClaw: Real or Hype?

A LIGHTNING TALK · MARIÁN BOĎA

THE SCEPTIC

I didn't buy it.

- → "It's just a thin wrapper on Claude Code"
- → "I can already do everything this thing advertises"
- → Meanwhile — fastest growing project on GitHub
- → People buying Mac Minis *just* to run it

So I bought a Mac Mini.

(pause for effect)

⚠ SAFETY FIRST

It's powerful — and dangerous.

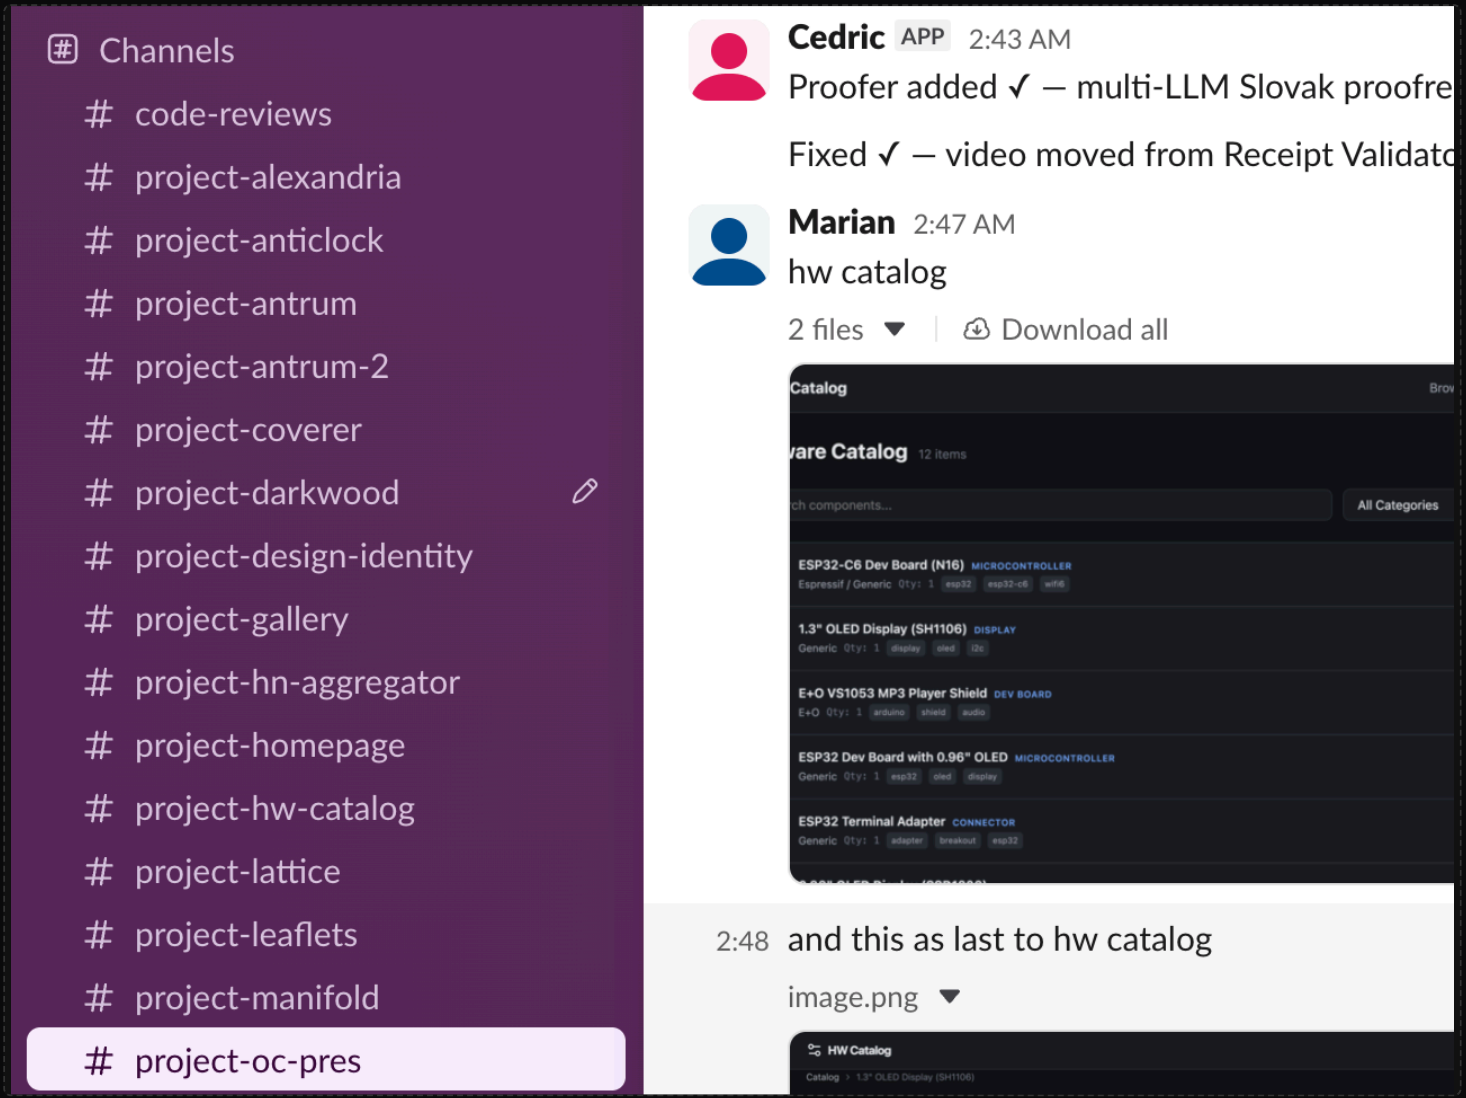
- No personal stuff on the machine. No personal accounts.
- Created a VM inside — that's where it lives
- Ephemeral and isolated. Think pet tiger in a cage.

THE SETUP

Meet Cedric 🦊

- → Connected to Telegram first, then moved to Slack
- → One dedicated Slack channel per project
- → Sub-agents serve each channel

One channel per project



INFRASTRUCTURE

Own domain. Own VPS. Dokku.

One prompt → fully deployed project on a subdomain

Prompt → Cedric → GitHub → Dokku → *.sandscape.cc

WORKFLOW

From prompt to production

- → Dedicated code review agent scans every PR
- → Sub-agents handle the full pipeline: code → test → deploy
- → Important projects: stops at PR, **human has final word**

```
# what it looks like in practice
marian: "build a receipt scanner for Slovak shops"
# ... 20 minutes later ...
cedric: "deployed → receipts.sandscape.cc ✓"
```

THE OUTPUT

~25

projects in a few weeks

↓ scroll down to explore them

PROJECT SHOWCASE

Let me show you.

Open Project Showcase →

fullscreen · keyboard nav · ↑↓ projects · ←→ media · F fullscreen

THE VERDICT

Real. But handle with care.

- → It IS powerful — the output speaks for itself
- → It IS dangerous — **isolate it properly**, no exceptions
- → Destination: **personal software**

ADVICE

A little bit of advice

- → Don't use cheap models
- → Don't connect to your social accounts
- → API use is expensive
- → You don't need a Mac Mini — **one Hetzner VPS is enough**
